

Hemminger questions on Delaware River project:

1. Green Space: I know Jim has two different interpretations. Need to know which one he is going to use and if this project meets the green space requirements.
(Flat I calculate 9.6 acres of panels per parcel, they calculate it as 3.39 acres)
2. Applications states, "minimal noise and no nighttime noise." How minimal (decibels)?
3. Are the deciduous trees what we really want as screening?
4. Where will monitoring be performed? What type of internet connection will be used?
5. What lighting will be used? Will it be motion activated?
6. Verify the modules/arrays will not be cleaned with chemicals, how will they be cleaned?
7. Will all damaged modules be removed from the site and all residue from the damage cleaned up and removed?
8. Verify that only panels that pass the TCLP test will be used on this project?
9. Although I understand that you checked with other land owners, verify that no land owners along the RG&E interconnection area were willing to lease land.
10. Appendix I is confusing and raises questions. Although it may meet "EPA Regulations" what are the actual concentrations of waste materials?
11. Request photo simulation of view from different angles along both Fox and Yellow Mills Roads.
12. Since land will be leased from an "Affiliate of DRS". Who is this affiliate? Does that not muddy the water on a decommissioning plan and the rest of the agreed upon items?
Page 2 of Appendix I

Note: 28 modules per array/rack, 250 arrays/racks per parcel, array is 45.7'x12.2'
